Lesson 17: Forms And Multi-Screen Data Flow

A LEADING POLYTECHNIC COMMITTED TO YOUR SUCCESS

Lesson Objectives

By the end of this lesson, students should be able to:

- build controlled input fields for a small form
- explain which values stay local while typing
- apply simple validation before submit
- save committed form data into shared state
- show the submitted result on another screen through the shared provider

WE ARE ESSENTIAL TO ALBERTA | NAIT

Lesson Roadmap

1. Reconnect lesson 16 to a new form workflow
2. Define local draft versus committed shared data
3. Build one controlled form with validation
4. Submit the valid result into Context
5. Confirm the saved result across screens
6. Checkpoint and lesson-18 handoff

WE ARE ESSENTIAL TO ALBERTA | NAIT

Starting Point From Lesson 16

- keep the same local backend and `{ id, label }` study-step data
- keep the same shared selected-step feature
- keep the provider at the shared layout level

What changes today

- a new form screen collects draft session details
- draft input stays local while typing
- the submitted session result becomes shared

WE ARE ESSENTIAL TO ALBERTA | NAIT

Two Kinds Of Form Data Today

1. local draft data
2. committed shared data

Plain-language version

- while the user is typing, the draft belongs to the form screen
- after the user submits valid data, the saved result can belong to shared state

WE ARE ESSENTIAL TO ALBERTA | NAIT

Controlled Inputs In Plain Language

- the input value comes from state
- typing updates that state
- the screen shows the current state value

Useful pattern

- `value={title}`
- `onChangeText={setTitle}`

WE ARE ESSENTIAL TO ALBERTA | NAIT

What Stays Local In This Lesson

- current title text while typing
- current goal text while typing
- current validation error message on the form screen

Why

- these values belong to the form draft before submit

WE ARE ESSENTIAL TO ALBERTA | NAIT

What Becomes Shared After Submit

- the saved session title
- the saved focus goal
- the selected-step count attached to the saved session

Why

- another screen needs to show the committed result

WE ARE ESSENTIAL TO ALBERTA | NAIT

Validation Today

- session title is required
- at least one study step must already be selected

Keep it simple

- one short error message is enough
- the goal is clarity, not advanced validation rules

WE ARE ESSENTIAL TO ALBERTA | NAIT

Build Order Today

1. add local draft state on the form screen
2. connect controlled inputs
3. add simple validation checks
4. save the valid result into Context
5. show the saved result on the summary screen

WE ARE ESSENTIAL TO ALBERTA | NAIT

Visible Clues To Confirm Success

1. try to submit an empty title
2. observe the validation message
3. enter a valid title
4. submit the form
5. open the summary screen

Expected clues

- one visible validation message before submit succeeds
- one visible saved session result after submit

WE ARE ESSENTIAL TO ALBERTA | NAIT

Common Wrong Turns

- moving draft input text into Context too early
- validating after save instead of before save
- forgetting that the form screen still needs local state
- treating shared state as the home for every input keystroke

WE ARE ESSENTIAL TO ALBERTA | NAIT

Midpoint Check

By the middle of class, students should know:

- which values are local draft values
- which values become shared after submit
- what validation rule is active
- what screen shows the committed result

WE ARE ESSENTIAL TO ALBERTA | NAIT

Checkpoint

Students should be ready to show

- one controlled form field
- one visible validation clue
- one valid submit path
- one summary screen showing the committed shared result

Status language

- `resolved` : the full local-draft to shared-summary flow works
- `partial` : some form or validation wiring works, but the full flow is incomplete
- `blocked` : the form or data-flow path is still broken or unclear

WE ARE ESSENTIAL TO ALBERTA | NAIT

What We Learned Today

- controlled inputs keep form drafts readable
- draft input can stay local while typing
- simple validation helps prevent invalid submit flow
- committed form data can move into shared state after submit

WE ARE ESSENTIAL TO ALBERTA | NAIT

Next Step

- keep the form workflow small and clear
- keep draft and committed state roles distinct
- prepare to stabilize the full shared-state and forms workflow in lesson 18

Ready after lesson 17 means

- `resolved`: the validated form saves and shows the committed shared result
- `partial`: repair at least the form route, one visible validation clue, and one saved-title summary clue before lesson 18 starts
- `blocked`: the multi-screen form flow still needs instructor-guided recovery
